

# Tech Specs

## TubeGuru 6C33C

### TubeGuru 6C33C single ended stereo amplifier \$10,000.

The main characteristics of the 6C33C are that it has very high transconductance, high current capability and low internal resistance. The tubes were intended for use in military aircraft and are mechanically very robust. The sound is extremely robust, with great bass impact and a holographic soundstage.

The tube delivers extremely high current (2-3 amps) which partially explains the extremely robust sound.

It has very low output impedance (9X lower than the 300B) which results in a three-dimensional transparent sound.

The tube's inherent characteristics make it possible to design a wide bandwidth output transformer with a frequency range of 7hz-80khz.

It also has a very high damping factor which results in fantastic bass control.

Driver tubes: E83F and 6463 (ECC86)

(3) fully tube regulated Voltage Regulation tubes: VR105

Full-Wave Rectification: 5U4G

14 watts per channel
